Declaring & Defining

The functions don't yet exist, but we can declare (or <mark>prototype</mark>) them right before the `main` function starts like this:

```
void printTitle();
double getInput();
double ouncesToTons(double ouncesPerBox);
double boxesPerTon(double tonsPerBox);
void printResults(double tons, double boxes);
```

Function Definitions

Once you have done that, make a copy of the prototypes <mark>following</mark> the `main` function. Replace each of the semicolons with a function body. Then, copy the original code (from your homework solution) into the appropriate body, and your program will work.

Here's a link to my version of this program if you want to compare it to yours.
