Stub the Function

You should be able to <mark>stub out the function</mark> on your own. You shouldn't have to think about this part; you should memorize and practice each of these steps until they become second nature.

1. **Open the file using the supplied filename**.

2. If it can't be opened, then print the error message using `cerr`. To check if the file was opened, **explicitly** use the `fail()` function or, **implicitly** check using the stream variable itself. If you use the second method, don't forget the **not operator**.

3. Instead of adding an `else` to the `if` statement, add a `return` statement to end the function if nothing else can be done.

4. Add the <mark>line-oriented I/O pattern</mark>. You will have read and printed every line, and so you'll be ready to go on to the next step, where you actually solve the problem.
